ESTA's Technical Standards Program

The ESTA Technical Standards Program was created to serve the ESTA membership and the entertainment industry in technical standards related matters. The goal of the program is to take a leading role regarding technology within the entertainment industry by creating recommended practices and standards, monitoring standards issues around the world on behalf of our members, and improving communications and safety within the industry. ESTA works closely with the technical standards efforts of other organizations within our industry including USITT and VPLT as well as representing the interests of ESTA members to ANSI, UL and the NFPA. The Technical Standards Program is accredited by the American National Standards Institute.

The Technical Standards Council (TSC) established by ESTA's Board of Directors to oversee and coordinate the Technical Standards Program. Made up of individuals experienced in standards making work from throughout our industry, the Committee approves all projects undertaken and assigns them to the appropriate working group. The Technical Standards Council employs a Technical Standards Manager to coordinate the work of the Committee and its working groups as well as maintaining a "Standards Watch" on behalf of members. Working groups include: Control Protocols, Electrical Power, Event Safety, Floors, Fog and Smoke, Followspot Positions, Photometrics, Rigging, and Stage Machinery.

ESTA encourages active participation in the Technical Standards Program. There are several ways to become involved. If you would like to become a member of an existing working group, as have over two hundred people, you must complete an application which is available from the ESTA website. Your application is subject to approval by the working group and you will be required to actively participate in the work of the group. This includes responding to letter ballots and attending meetings. Membership in ESTA or any other organization is not a requirement for participation in the TSP. You can also become involved by requesting that the TSC develop a standard or a recommended practice in an area of concern to you.

The Working Group, which authored this standard, consists of a cross section of entertainment industry professionals representing a diversity of interests. ESTA is committed to developing consensus-based standards and recommended practices in an open setting.

Investors in Innovation

The Technical Standard Program (TSP) is financially supported by ESTA and by companies and individuals who make donations to the TSP. Contributing companies and individuals who have helped fund the TSP are recognized as “Investors in Innovation”. The Investors in Innovation when this standard was approved by ANSI's Board of Standards Review are as follows:

Memorial donor: The Estate of Ken Vannice

All donations to the Technical Standards Program benefit the entire program, and are not directed to any specific use or project within the program. Please help support the Technical Standards Program by becoming an Investor in Innovation. Visit our website at <http://tsp.esta.org/invest>, or contact the ESTA office at 1-212-244-1505 and select "TSP" from the menu.

Introduction

Successful planning for and managing of events often requires a group of people, a team approach where information is shared and easily accessible. Using clear and easily understood language is a critical component of realizing a safe event. The event safety management planning (ESMP) team should include everyone who has a vested interest, and plays an integral role, in producing the plan that ensures a safe event. This team includes, but certainly is not limited to, the event organizer, contractors, subcontractors, venue owners, managers, and government agencies such as local, regional, and national law enforcement, fire, health, emergency medical, and emergency management personnel. All these entities play an integral role in producing a safe event.

The goal of this standard is to identify and describe the steps necessary to create a reasonable level of safety throughout all phases of the event including planning for and responding to emergencies. This includes identifying the roles and responsibilities of the event organizer and the applicable event personnel.

1 Scope, purpose and application

This standard describes a process for event organizers and supporting staff to create and implement event-related plans for health and safety management. This process includes a framework, guidelines, and recommended practices that can be used to reduce risk as much as reasonably practical and to respond appropriately when an incident occurs.

1.1 Purpose

The purpose of this standard is to identify and describe the steps necessary to create a reasonable level of safety throughout all phases of an event.

1.2 Intent

This document is intended for use by both users and enforcement officials in order to help establish and maintain minimum standards for care and public safety for events.

1.3 Equivalency

The provisions of this standard are not intended to prevent the use of any materials or to prohibit any design, method of fabrication, or services not specifically prescribed by this standard, provided that any such alternative materials, design, method of fabrication, or services meets or exceeds the intent of the provisions of this standard. This standard is not intended to replace or supersede any applicable local, regional or national regulation or laws, but should supplement them, with the ultimate goal of improving safety.

1.4 Application

This document is one part of a larger collection of standards relating to event safety, but it is a parent document, strengthened by those individual parts. The requirements of the complete collection must be considered in relation to the application of this standard, to coordinate and correlate all related requirements into the scope of an event.

1.5 Normative references

The following documents contain requirements relating to the scope of this standard. They are provided for guidance only, unless otherwise referenced specifically elsewhere within this standard. Where a specific version is not given, the version applicable to the event's state, local, or municipal jurisdiction (authority having jurisdiction) should be used. European standards are also recommended for review, as they are useful sources of guidance where domestic national standards do not already exist.

2 Definitions

2.1 Authority having jurisdiction (AHJ): An organization, office, or individual responsible for enforcing the requirements of a code or standard, or for approving equipment, materials, an installation, or a procedure.

2.2* Competent person: One who is capable of identifying existing and predictable hazards in the surroundings or working conditions and who has authorization to take prompt corrective measures to eliminate them.

2.3 Control measure: Actions that can be taken to reduce or eliminate exposure to a hazard or to reduce the likelihood of the risk of exposure to that hazard being realized. (<https://www.hsa.ie/eng/Topics/Hazards/>).

2.4* Emergency action plan (EAP): A written document that memorializes staff duties and responsibilities, during both normal and emergency operations, and that incorporates and describes the actions event organizers and personnel should take to ensure safety during an incident.

2.5 Emergency operations plan (EOP): A reference and planning document that assigns responsibility to organizations and individuals, sets forth lines of authority and organizational relationships, describes how people and property are protected, identifies personnel, equipment, facilities, supplies, and other resources, and reconciles requirements with other jurisdictions during a disaster.

2.6 Event: A planned, nonemergency activity (e.g., sporting event, concert, parade, mass gathering) usually conducted proximate to a live audience. When used in this standard, an “event” shall always mean a live event.

2.7 Event duration: The length of time from the start of event phase 2 (the entire period the event occupies the site) through the end of event phase 3 (completion of load-out and/or site restoration).

2.8 Event health and safety: As used in this standard, includes health and safety laws and policies that provide the health and safety framework for the rights and duties of all parties that participate in an event.

2.9 Event organizer: The individual, group or organization (or their authorized representatives) that originates, organizes, promotes and/or manages an event. The event organizer is ultimately responsible for the event.

2.10 Event personnel: Anyone working the event including the production team, supervisors, employers, employees, contractors, subcontractors, laborers, volunteers, performers, venue owners or venue operators, vendors, etc.; Event staff.

2.11 Event phases

2.11.1 Event phase 1 (“pre-planning,” planning, pre-event, pre-production): The period before event phase 2 begins and when all aspects of the event are considered and planned prior to the event. During this event phase, risk assessments are completed, all event-related plans are created and approved, and all elements related to the event are considered and planned.

2.11.2* Event phase 2 (the event, at the event site, at the venue): The period of time immediately following event phase 1 and prior to event phase 3 when the event organizer occupies and becomes responsible for the event venue or site. This phase includes not only the actual event time (when the attendees are present) but also includes the setup time (including initial site layout and marking of the site, if applicable) and the dismantle time, along with execution of a site restoration plan, which would include returning the venue or site to its original state before the event began, if applicable.

2.11.3* Event phase 3 (post-event): The period of time immediately following event phase 2 when the event organizer has relinquished control of the venue or site back to the its owner. Typically during this event phase, final accounting is completed; post event analysis reports are developed, reviewed and discussed; rental items are returned; recaps are completed; documentation is stored; and assets are stored and managed for future use. This event phase often does not have a specific time frame.

2.12* Event safety management plan (ESMP): A collection of subordinate plans and documents that describes how safety will be achieved, managed, and maintained for all those present during all phases of an event. For the purposes of this standard, ESMP is the term for the umbrella plan that incorporates all safety plans, policies, and documentation related to the event.

2.13 Event safety management planning team (ESMPT): The group of people who have a vested interest, and play an integral role, in producing the plan to ensure a safe event, including, but not limited to, the event organizer, contractors, subcontractors, venue owners, managers, and government agencies such as local, regional, and national law enforcement, fire, health, emergency medical, and emergency management personnel.

2.14 Event safety meeting: A daily meeting in which all event personnel receive role-specific, relevant, health and safety information for the event site that day including, but not limited to, safety-related laws, rules, onsite hazards, policies, and procedures; A site safety briefing.

2.15 Hazard: Anything with the potential to harm people, structures, and facilities; A condition that presents the potential for harm or damage to people, property, or environment;. Something that is potentially dangerous or harmful, often the root cause of an unwanted outcome (NRF, 2008; FEMA EMI, 2018).

2.16 Health and safety: A general term referring to regulations, laws, rules, principles, guidelines, policies and procedures that are intended to keep people safe from injury or disease at work or in public places. Sometimes referred to as "Occupational Safety and Health" or "Life Safety."

2.17 Health and safety coordinator: A competent person authorized by the event organizer to coordinate and comply with all safety related requirements (e.g., relevant laws, regulations, standards), take actions to ensure the safety of everyone on site, monitor all activities for safety, ensure safe methods and practices are being used for all operations, and producing and maintaining appropriate and complete documentation for all safety-related activities conducted in all phases of an event.

2.18 Health and safety management: The task of managing matters of health and safety and related risks as part of an event which is defined in the Event Safety Management Plan (ESMP).

2.19 Health and safety policy: A written document that demonstrates the event organizer's commitment to health and safety, and details the mission, intent, criteria, considerations and conditions necessary to promote and maintain a healthy and safe environment at a particular event or for all activities in which the event organizer may participate. This is often part of, or incorporated by reference in, the event safety management plan (ESMP).

2.20 Incident: An unplanned occurrence, natural or human-caused, that requires a response to protect life, property, or the environment (FEMA EMI, 2018). For the purposes of this standard, there are two categories of incidents: minor and major (see *Minor Incident* and *Major Incident*).

2.21 Incident Action Plan (IAP): The incident-specific plan reflecting the overall incident objectives, strategy, tactics, risk management, and member safety that are developed by the incident commander at an incident. Incident action plans are updated throughout the incident, usually within each operational period (NFPA Glossary, 2021; NFPA 1500, 2018). In ICS applications, the IAP is a compilation of selected ICS forms and related documents that is generated for each operational period.

2.22* Incident Command System (ICS): Generally, ICS is an Incident Management System (see *Incident Management System [IMS]*). Specifically, ICS is a management system designed to enable effective and efficient incident management by integrating a combination of facilities, equipment, staff, procedures, and communications operating within a common organizational structure.

2.23 Incident Commander: In ICS applications, the individual responsible for all incident activities, including the development of strategies and tactics and the ordering and the release of resources (NFPA 472, 2018; NFPA Glossary, 2021).

2.24 Incident management center (IMC): The physical location/facility where incident management functions are conducted. The IMC is part of an incident management system (IMS) and may be a facility within an application of the incident command system (ICS); Incident command post; Incident command center.

2.25* Incident management system (IMS): A general term for a system that defines the roles and responsibilities to be assumed by responders and the standard operating procedures to be used in the management and direction of emergency incidents and other functions (NFPA 1561, 2020, *Standard on Emergency Services Incident Management System and Command Safety*).

2.26 Incident management team (IMT): Within the incident command system (ICS), an IMT is a group that includes the incident commander and the appropriate command staff (officers who answer directly to the incident commander: Safety Officer, Liaison Officer, Information Officer) and general staff (responders that serve as section chiefs of the operations, planning, logistics, and finance/administration sections of the IMS) personnel assigned to an incident (FEMA Glossary, 2022; NFPA 1561, 2020).

2.27 Load-in: The act of setting up the event at the event site. The Load-In includes unloading a truck and setting up equipment. Also referred to as: setup, install, build.

2.28 Load-out: The act of dismantling equipment used during the event; packing it in boxes, crates, or cases designed for travel; and, loading the truck(s) that will remove the items from the site. Also referred to as: "dismantle," and "tear down."

2.29* Major incident: An incident that did, or has the potential to, result in serious harm to numerous persons, significant property and/or environmental damage, and which does or may require an immediate response and intervention from the local authorities or emergency services. A major incident is likely to escalate and produce significant consequences that cannot be managed with onsite resources.

2.30 Mass gathering: An occasion, either organized or spontaneous, where the number of people attending is sufficient to strain the planning and response resources of the community, city, or nation hosting the event. (World Health Organization).

2.31* Minor incident: A simple, undesired event (a) that adversely affects a task or process, (b) whose consequences can be managed through normal service delivery, and (c) which is not likely to escalate.

2.32 Must: Interchangeable with "shall" and indicates a mandatory requirement.

2.33 Occupational safety and health (OSH): See "Health and safety".

2.34 Personal protective equipment (PPE): The safety equipment worn by a user to prevent bodily harm, required only to mitigate the residual risk of injury after all technical and organizational means to mitigate and control the risk of injury have been implemented, - e.g. safety shoes, high visibility vests, hard hats, fall arrest harnesses, etc.

2.35 Post-event analysis (PEA): As used herein, assessment or evaluation reports documenting the successes and/or failures of any safety related policy, document, action, incident etc., which resulted from the event.

2.36 Qualified person: A person who, by profession or recognized degree, or certificate of professional standing, or by extensive knowledge, training, and experience, has successfully demonstrated the ability to solve and resolve problems relating to the subject matter and work.

2.37* Risk: Having the capacity to produce harm or loss that is measured in terms of likelihood of occurrence and severity of impact.

2.38 Risk assessment: A process to identify potential hazards and analyze what could result from exposure to hazards (Ready.gov). A risk assessment should also include suggestions for mitigation/control measures to reduce the risk to an acceptable level.

2.39* Safety data sheet (SDS): An SDS includes information such as the properties of each chemical; the physical, health, and environmental health hazards; protective measures; and safety precautions for handling, storing, and transporting the chemical. It provides guidance for each specific chemical on things such as personal protective equipment (PPE), first aid procedures, and spill clean-up procedures.

2.40 Security: Most broadly, security is the protection of people or property from harm (ES1.40). As used in this standard, the branch of an organization, public or private, charged with the responsibility of safeguarding the assets (people, physical plant, properties, products and reputation) of an organization.

2.41 Shall: Is interchangeable with “must” and indicates a mandatory requirement.

2.42* Should: Denotes a non-mandatory recommendation; that which is advised but not required.

2.43 Site map: A map, usually created digitally and to-scale, showing the basic layout of the venue, site, or area related to an event, may show an indoor event’s floor plan, and that shows all the event’s critical, on-site elements; Site plan.

2.44 Site safety rules: Required guidelines that describe exactly how an event organizer or venue expects everyone entering the site to behave.

2.45 Staff: See “event personnel.”

2.46 Vulnerable persons: Those in need of protection, who may not be fully capable of decision making, and who hold membership to undervalued groups within society.

3 General

Every event must comply with all local, regional and national laws and regulations as per the authority having jurisdiction (AHJ). Every event shall be constructed, designed, equipped, maintained, and operated in accordance with this standard so as to provide protection from reasonably foreseeable risks, their actual and potential hazards related to the health and safety of everyone involved in the event, any property used by the event, and the environment.

3.1 Initial planning requirements

Every event, regardless of the size, must have an initial, comprehensive planning meeting. This initial meeting will define the scope of the event and will include, but is not limited to, the following topics:

- Roles
- Licenses
- Permitting
- Procedures
- Production
- Staffing (event personnel)
- Titles
- Timelines

3.2 Risk assessment required

All events, regardless of size, complexity, or request by AHJ, must go through a comprehensive risk assessment process to identify and mitigate all reasonably foreseeable risks. The risk assessment shall meet the requirements of 4.8.

3.2.1 Separate risk assessments must be created at the departmental level. The number of departments involved will depend upon the size and complexity of the event.

3.2.2 Event organizers should appoint, hire, or work only with qualified persons, for their advice, council, and health and safety expertise.

3.2.3 The risk assessment must be easily understood and made readily available to all parties involved in the planning and execution of the event.

3.2.4* The risk assessment should be written.

3.3 Event safety management plan (ESMP)

Every event should have a written event safety management plan (ESMP) that includes protocols for minor and major incidents, and at least one written risk assessment. Length and complexity of the ESMP will depend on the complexity and size of the event.

3.3.1 The ESMP should include, but may not be limited to, the following:

- Identification of the event type (artists, performers, etc), anticipated number of attendees, and the anticipated demographics of the attendees
- Identification of the event size, and its absolute maximum occupancy
- Identification of the event site, so venue and site design can do its thing
- Roles and responsibilities of the management team,
- Identification of key staff,
- Information on site/venue infrastructure (venue and site design),
- A risk assessment (RA), although this may not be written for a small event,
- Details plans and emergency procedures to activate if an incident occurs, and
- An emergency action plan (EAP).

3.3.2 The ESMP must be easily understood and made readily available to all parties involved in the planning and execution of the event.

3.3.3 All equipment, devices and materials shall be used in accordance with the manufacturer's instructions and, where required, display all necessary labels and limitations.

4 Event phase 1: Planning the event

4.1 Event organizer

4.1.1 The event organizer shall initiate the planning of the event and shall be responsible for all health and safety related issues during all phases of the event.

4.1.1.1 The overall responsibility for health and safety-related issues must not be delegated away from the event organizer, but the tasks associated with this responsibility may be delegated to others.

4.1.1.2* Health and safety related tasks must only be delegated to competent, and preferably qualified, persons.

4.1.3 Responsibilities of the event organizer include but are not limited to:

- Oversight of the activities of the health and safety coordinator.
- Creation and oversight of an overall health and safety framework for all entities that participate in the event during all event phases.

- Approval of specific health and safety policies that are intended to protect attendees and event personnel from reasonably foreseeable risks during all event phases, and
- Oversight and approval of a plan to address all reasonably foreseeable emergencies that might occur during any event phases.

4.1.4* The event organizer should obtain health and safety, legal, and insurance advice from qualified persons early in event phase 1 (planning phase).

4.1.5* The event organizer must provide instruction and supervision, conduct relevant training, and ensure compliance with procedures, communication methods, and rules.

4.1.6 The event organizer should frequently review and update planning documents as part of the risk assessment and hazard mitigation process.

4.2 Health and safety coordinator

All events must have at least one health and safety coordinator.

4.2.1 Health and safety coordinators must be members of the event safety management planning (ESMP) team.

4.2.2 The role of health and safety coordinator must not be filled by the event organizer.

4.2.3* The health and safety coordinator must not have other roles or responsibilities that would prevent material fulfillment of the duties as the health and safety coordinator.

4.2.4 The health and safety coordinator shall be responsible for, but not limited to, the following:

- Compliance with all applicable health and safety regulations,
- Compliance with all liabilities governed by applicable regulation in the location(s) that the event operates,
- Identifying existing and reasonably foreseeable risks of the event,
- Identifying potential liability incurred by the event due to the strain on emergency services and surrounding areas, if the event experiences a major emergency (major incident), and
- Documenting incidents and accidents.
- Establishing and recording the details of the health and safety policy that are intended to protect attendees and event personnel from reasonably foreseeable risks during all event phases.
- Seeking guidance from relevant AHJs and other related agencies to ensure compliance with all applicable regulations.
- Ensuring that first-aid kits, and personnel trained in their use, are available during all event phases.
- Ensuring there is active monitoring of health and safety systems, and procedures, during all event phases.
- Posting health and safety policies and procedures, with emergency contact information in locations that are clearly identified and easily accessible to all event personnel, prior to commencement of any onsite work.
- Communicating the event site safety rules to all event personnel, prior to commencement of any onsite work.
- Conducting safety meetings prior to all event phases.
- Clearly demarcating all discrete work zones, prior to commencement of any onsite work.

4.2.5 Health and safety coordinator tasks must only be delegated to competent persons.

4.2.6 All persons performing health and safety coordinator tasks shall be authorized by the event organizer to do at least the following:

- Inform all event personnel about the hazards and risks that exist at the event site, and work to create cooperative strategies and procedures to minimize those identified hazards;
- Take prompt and corrective action to mitigate or eliminate identified reasonably foreseeable risks;
- Have access to all safety documentation supplied by the contractors and the event organizer;

- Ensure all event personnel understand how health and safety policies and procedures will be implemented, monitored, and enforced before they begin work on site;
- Clearly identify and communicate each relevant staff member's role and responsibility as they may relate to all reasonably foreseeable risks and emergencies during the event (This communication will outline who has decision making authority, and in which circumstance);
- Communicate emergency response requirements and information to all event personnel and attendees in a manner that is appropriate for their roles and responsibilities during an emergency; and
- Establish and maintain records as required by the authority having jurisdiction and the event organizer.

4.2.7 The specific work of a health and safety coordinator should be accomplished in coordination with the event organizer and other departments including, but not limited to, security personnel, medical team, law enforcement and human resources.

4.2.8 The health and safety coordinator must also be authorized to evaluate the need for special services, including, but not limited to, the following:

- Accessibility needs
- Communications
- Literature and health services pertaining to substance usage, hydration, temperature exposure and management of (both for heat and cold), sexual harassment strategies
- Public health announcements
- Signage
- Support and assistance to vulnerable persons based upon the circumstance of the event

4.2.9 The health and safety coordinator should have procedures in place to react if an accident or incident occurs. The procedures should include as much information as possible such as but not limited to:

- Additional hazards and omissions in safety standards
- Documenting what occurred through incident reports, accident reports, and lost person reports
- Incidents with the potential to cause further injury
- Identifying and reporting injuries to the health and safety coordinator
- Identifying losses such as property damage
- Photos and videos

4.2.10 The health and safety coordinator should follow the guidance provided in chapter 6, Communications, of the *Event Safety Guide* (2014, Event Safety Alliance).

4.2.11 As size and complexity of the event increases, it becomes more important that the health and safety coordinator role be assigned to a qualified person with training in relevant national standards and with a working knowledge of at least the following:

- Events and how the event industry differs from other industries,
- Emergency planning and management,
- Individual tasks that need to be completed, including the writing of plans, policies, and procedures,
- Fire and building codes/regulations and laws,
- Event-related construction,
- Applicable industrial laws and regulations, and
- Occupational safety and health laws and regulations applicable in the location (jurisdiction) where the event is being held.

4.2.12 Methods of informing event personnel of these matters may include, but are not limited to:

- Individual (direct) communications,
- Team or group presentations,
- Training videos, and
- Written memos and instructions.

4.2.13 During event phase 1, the event organizer must seek advice from the health and safety coordinator regarding all contracts and agreements between the event organizer and their contractors to ensure the contracts and agreements adequately address issues related to health and safety at the specific event.

4.2.13.1 All contractors should have their own insurance policy or be willing to share the expense of a group insurance policy.

4.2.13.2 Contracts and agreements with contractors should specify a minimum amount of insurance coverage and desired level of indemnity.

4.2.13.3 Relevant insurance schedules should be provided by all contractors for review by the event organizer and health and safety coordinator to ensure correctness, adequate coverage levels, and to determine if advice from a broker is required.

4.3 Meetings and Documentation

The event organizer must hold at least one planning meeting prior to the start of event phase 2 to review the initial risk assessment and event safety management plan (ESMP), and to revise them if necessary, based on changes made during the time frame between phase 1 and phase 2.

4.3.1 For the event safety management plan (ESMP) to function as intended, and depending on the size and complexity of the event, the health and safety coordinator should set up a series of ESMP meetings between all relevant entities.

4.3.2 During event phase 1, the health and safety coordinator should plan for the communications of site safety rules, which should include briefings that will be held prior to event personnel entering the site.

4.3.3 Site safety rules must describe exactly how an event organizer or venue expects everyone entering the site to behave and must meet the minimum requirements of the venue's AHJ. The rules may be stricter than applicable local, regional, and national laws, and must be formulated in accordance with the recommended ESMP criteria in 3.4.

4.3.4 The health and safety coordinator must satisfactorily address any questions or concerns from all attending the event safety meeting.

4.3.5 An event safety meeting must be held prior to the start of each show and attended by all relevant event personnel.

4.3.6 If there are changes to health and safety information during a multi-shift or multi-day show, that information must be communicated to all event personnel.

4.3.7 Due to the numerous government agencies, emergency services (e.g., first responders) and private entities external to the event (e.g., private service providers) that will likely be required to respond and assist at a major incident, coordination must be provided between these entities and their event-related counterparts who have responsibilities for health and safety at the event such as the event organizer, health and safety coordinator, ESMP team, and those staffing the incident management center. The specific ways in which this coordination occurs, and the specific roles and responsibilities associated with it, should be identified and planned in event phase 1 and included in the ESMP.

4.3.8 A representative from one agency, such as the local fire or police department, should serve as the single point of contact for accessing outside government agencies and responders. This representative should be on-site, in the incident management center. Larger events may require additional responder representation in the incident management center.

4.3.9 All necessary documentation required by applicable codes and the authorities having jurisdiction (AHJ) for the event shall be maintained on-site throughout all event phases.

4.3.10 It is recommended that all relevant documents be maintained in the ESMP as part of a binder or file. The health and safety coordinator should ensure that incident forms are available for each anticipated incident, and must create procedures for these forms to be completed and kept on file. The ESMP file should be easily identifiable as such and readily accessible.

4.3.11 The health and safety coordinator must communicate the site safety rules in writing to all event personnel in advance of arriving onsite.

4.3.12 For suppliers and contractors, written site safety rules should be part of the contract.

4.3.13* The use of preapproved forms is recommended for the reporting of event-related near-misses, accidents, and incidents. The forms should be readily available for use by event personnel during all phases of the event and completed as necessary. Any such forms must meet all legal requirements as set out by employment laws, workplace health and safety laws, and local legislative requirements.

4.3.14 Safety data sheets (SDS), which are required for all hazardous chemicals present at the event, must also be made available to the end user event personnel as well as event personnel assigned tasks in response to an emergency.

4.3.15 SDS sheets should also be contained within the ESMP file and produced on request by the AHJ or other affected parties and regulators.

4.3.16 The health and safety coordinator should frequently review and update planning documents.

4.4 Site maps

Site maps must be prepared for each event, and should be developed early in event phase 1.

4.4.1 Site maps should be developed according to the guidance provided in chapter 8, Venue and Site Design, in the *Event Safety Guide* (2014, Event Safety Alliance).

4.4.2 If applicable, required engineering documents and calculations, renderings, and contractor-specific plans must be obtained. These documents will be needed during planning meetings when discussing the event with inspectors, regulators, and emergency services representatives.

4.4.3 The event organizer must take into consideration the surrounding areas when selecting an event site. This may include but is not limited to obtaining permission, whether by law or consideration, regarding surrounding wildlife, and from neighboring facilities and residences to produce the event.

4.4.4 Venue and site design should be developed according to the guidance provided in chapter 8, Venue and Site Design, in the *Event Safety Guide* (2014, Event Safety Alliance).

4.5 Event safety management plan (ESMP)

4.5.1 The following are the minimum topics that must be evaluated and documented in the ESMP, depending on the reasonably foreseeable risks of the event. Topics should include but are not limited to:

- Risk assessment(s)
- Health and safety Policy
 - Roles, responsibilities, and training of event personnel
 - Chain of command, line of authority
- Contact details of key event personnel
- Dates, capacity and timings of the event
- Emergency contact numbers
- Location description (including appropriate plans and site maps)
- Event safety meetings
- Communication protocols, methods, and monitoring
- Incident reporting for different types of incidents

- Crowd management plan
- Disabled access, signage and located on maps
- Sanitary facilities, signage and located on maps
- Fire safety and response provisions, policies, and procedures
- Medical safety and response provisions, policies and procedures
- Security requirements and response provisions, policies and procedures
- Emergency protocols for evacuation
 - Evacuation plan(s)
 - Detailed emergency egress maps
 - Emergency directional signage,
 - Emergency announcements, texts, big screen narrative, etc.

4.5.2 Welfare considerations for event personnel during all phases of an event must be documented and included in the ESMP.

4.5.3 The ESMP must clearly state who has the authority to both stop and restart the event and what reasonably foreseeable scenarios would result in stopping a show.

4.5.4 The ESMP should include alternate authorized personnel for the stopping of a show and the procedures for taking such actions, should the primary personnel be unavailable or incapacitated.

4.5.5 The ESMP should describe, in detail, both minor and major incident plans and procedures to be implemented if an emergency arises.

4.5.6 If IMS is incorporated into the plan, the IMT must be involved in any meetings related to its involvement.

4.5.7* If the event is to be held in an existing venue, such as an auditorium, rental outdoor event space, arena or sports stadium, the health and safety coordinator must communicate with the venue management regarding any existing arrangements for health and safety. In this instance, the event-specific ESMP should supplement the venue's existing health and safety policy.

4.5.8 The health and safety coordinator must determine if the local regulation for the size or complexity of the event requires a separate emergency action plan (EAP). If it does, the plan must be included in the ESMP.

4.5.8.1 Emergency action plans must include the following information:

- Procedures for reporting of emergencies;
- Occupant and staff response to emergencies;
- Procedures for emergency evacuation, including type of evacuation and exit route assignments;
- Evacuation, relocation and shelter-in-place procedures appropriate to the building/site, its occupancy, emergencies, and hazards;
- Procedures to be followed by employees who remain to operate critical operations before they evacuate;
- Procedures to account for all staff after evacuation;
- Procedures to be followed by training staff performing rescue or medical duties;
- Appropriateness of the use of elevators;
- Design and conduct of fire drills;
- Type and coverage of building fire protection systems; and
- Other items required by the Authority Having Jurisdiction.

4.5.9 When necessary, due to the reasonably foreseeable risks or when required by local, regional or national regulation, the ESMP should be shared with local emergency services and AHJ's. This should be done prior to occupying the event site.

4.5.10 Once the ESMP has been compiled, the health and safety coordinator and all relevant entities must ensure that the event personnel responsible for implementing the plan fully understand their roles and responsibilities through written and verbal communications.

4.5.11 The ESMP must be reviewed and updated regularly by the health and safety coordinator to address developing and potential risks as the event progresses.

4.6 Health and safety policy

If a health and safety policy is deemed necessary by the ESMP, it must address items including, but not limited to:

- Roles and Responsibilities for event health and safety
 - ESMP team
 - Other event personnel
- Provision of Information
- Training and Consultation with event personnel
- Minimum Safety Standards that all event personnel must meet
- Safe Working Methods, Safe Access
- The Maintenance of a Safe event Site
- Welfare of all event personnel through all phases of the event

4.7 Event risks

4.7.1 Depending on the size and complexity of the event, facilities for first-aid services, and possibly Emergency Medical Services (EMS), must be available for those who will be on site (event personnel and Attendees).

4.7.1.1 These services and facilities must be made available throughout the entire event duration; from the time that the event first occupies the event site until work is completed.

4.7.2* If Emergency Medical Services (EMS) facilities are planned, they must be evaluated for the reasonably foreseeable hazards at the event, the type of work being performed, and follow the guidance provided in chapter 5, Medical, in the *Event Safety Guide* (2014, Event Safety Alliance).

4.7.3* Events with tents or overnight camping present unique risks that must be identified, evaluated, mitigated, and controlled.

4.8 Risk assessment

The risk assessment is the central pillar of risk mitigation at any event and is a first critical step in developing a comprehensive ESMP. It is the process of identifying physical and health hazards and often begins with a site inspection of the venue to develop a list of these potential hazards. It can be used as an effective tool to communicate roles and responsibilities and is also a helpful starting point for the major incident portions of the ESMP.

The risk assessment can be created using different methods and models. A simple example for completing and documenting a risk assessment is:

1. Identify the hazards
2. Decide who, what, and how someone or something could be harmed
3. Evaluate the risks, and deciding on control measures to mitigate them
4. Record the findings
5. Review the risk assessment

Preliminary risk assessments can start early in event phase 1, while planning the venue and site design. For complex events, the event organizer should consult an insurance or risk assessment expert to help create their event risk assessment.

4.8.1 Risk assessments should be developed according to the relevant guidance provided in chapter 8, Venue and Site Design, in the *Event Safety Guide* (2014, Event Safety Alliance).

4.8.2 The risk assessment should:

- Start with a physical examination of the event site or space while considering event elements such as but not limited to peripheral structures.
- Be a written document and made freely available to relevant event personnel.
- Undergo revisal, as necessary, throughout all event phases while retaining copies of all versions and ensuring all staff and contractors are working with the latest version.
- Mitigate or control residual risks to an acceptable level (i.e., the control measure[s]).

4.8.3 The control measure(s) should reduce the likelihood and severity of any residual risk to an acceptable level.

4.8.4 A consistent approach should be used for assessing event risks, and all reasonably foreseeable risks should be considered, which may include, but may not be limited to, the following:

4.8.4.1 Location and date

- Time of year
- Topography (Venue & Site Design)
- Weather (Weather preparedness)

4.8.4.2 Audience size and demographic

- Age of expected patrons (Communications, Medical, Lighting, Crowd management)
- Behavior (security, crowd management)
- Drugs and alcohol (Security, crowd management, medical)
- Expectations of the crowd while attending
- Overcrowding (Crowd management, Fire safety)
- Smoking and vaping policy (Communications, and whomever will enforce policy)

4.8.4.3 Site or venue

- Building(s) age and construction (Structural requirements, Fire safety)
- Capacity and suitability (Fire safety)
- Emergency announcement capabilities (Communications)
- Entry and exit requirements (egress – Crowd Management)
- Evacuation routes (egress – security and crowd management)
- Local transportation types (bus, trains, subways, parking etc.) and routes available
- “Major incident” hazards associated with the event (e.g. structure collapse, civil disorder, crushing, explosion, vehicular threat, active aggressor, fire, chemical release, food poisoning, bomb threats, suspicious packages, etc.)
- Neighboring venues and other local events that impact traffic, access and egress
- Power and electrical distribution (Electrical & Lighting)
- Rally and assembly points (Communications and Crowd management)
- Special considerations
- Access control (Security)

4.8.4.4 Event production

- Audio (Communications)
- Costuming
- Lighting (Electrical and lighting)
- Performers
- Proximity to hazards (Fire safety & others?)
- Pyrotechnic (Fire safety)
- Rigging (Rigging)
- Scenic and decorations
- Staging (Rigging, Structural safety)

- Temporary structures (ANSI E1.21 – 2020; ANSI ES1.19 - 2020)
- Video (ANSI E1.50 - 2017)

4.8.4.5 Production design

- Availability of hospitality and other social services (Medical)
- Backstage ingress and egress (Fire safety, Crowd management)
- Catering and promotions
- Directional signage (Crowd management, Communications)
- Emergency signs and lighting (Crowd management, Communications)
- Evacuation communication (Crowd Management, Communications)
- Maps and plans (Crowd management, Venue/Site Design, Communications)
- Occupancy load (Fire safety, Crowd management)
- Open flames (Fire safety)
- Required ingress and egress (Fire safety, Crowd management)
- Site safety meetings PMI, Department heads, HSC

4.8.4.6 Staffing

- Assignments and roles
- Availability of first-responders, EMT's, medical staff, police and fire
- Bullying, harassment and discrimination policies
- Documentation and reporting
- Evacuee and casualty verification
- Health and safety policies
- Other policies, protocols and procedures
- Qualifications, orientation, training and monitoring
- Staff sanitary facilities, food and beverage and rest areas
- Staff wellness, mental health care and facilities
- Work hours

4.8.4.7 Equipment

- External factors
- Heavy equipment
- Loading area availability
- Material handling
- Pedestrian access
- Storage of equipment
- Vehicles
- Waste handling
- Wait times
- Working at height

4.8.4.8 Logistics of equipment

- Damaged equipment and removal from service
- Documentation
- Equipment inspection
- Equipment storage
- Grounding, surge protection and isolation
- Lock out and tag out procedures
- Operating voltage(s) and cycle(s)

- Servicing protocols
- Unauthorized-access and tampering

4.8.4.9 Communication

- Mobile phones
- Communication breakdown
- Delayed evacuation
- Entrance and internal kiosks
- Intelligence from other agencies/entities regarding previous experience of similar events
- Limited visibility
- Media access
- Social media
- Stage PA
- Stage video Screens
- Walkie talkies

4.8.4.10 Security

- Additional police services
- Arrest and detain procedures
- Enhanced security methods (dogs, drones, metal detectors, barricades)
- Locations and positions of security staff
- Requirements and level of service provision
- Restricted egress
- Search protocols
- Threat assessment

4.8.4.11 Medical

- Level of service provision
- Location
- Requirements

4.8.4.12 Crowd Management (refer to ANSI ES1.9 - 2020)

- Asphyxiation injuries
- Bumps and bruises
- Crowd expectations
- Crowd movement routes
- Crush injuries
- Emergency egress
- Entrance wait times
- Ingress
- Lost and found people
- Monitoring crowd flows and potential overcrowding issues
- Slips, trips and falls

4.8.4.13 Food and Beverage

- Food handling and hygiene
- Fuel
- Ignition sources
- Open flame
- Sanitation

- Storage and safety

4.8.4.14 Sanitation services

- Chemical spills
- Disease exposure
- Site cleaning
- Waste removal and servicing
 - Sewage
 - Trash (including compost and recyclables)

4.8.4.15 Accessibility services and vulnerable persons

- Access assistance
 - Accessible facilities, including toilets and handwashing
 - Viewing and accessible areas
- Evacuation
 - Assistance
 - Duration
 - Routes

4.9 Major incident planning

4.9.1 The consequences of a major incident at any event can be catastrophic and will require additional planning. Event emergency planning is crucial to ensure that event personnel and attendees are safe and that hazards of the event are identified and mitigated effectively.

4.9.2 Event emergency planning identifies both minor and major incident hazards and risks. Planning should include times when the event may foreseeably strain existing public safety services or agencies.

4.9.3 Major Incident planning should begin with, but may not be limited to, a review of:

- Risk assessments
- Event design
- Site maps
- Operations
- Staffing plans
- Announcements and communications
- Emergency responses
- Evacuation procedures

4.9.4 For complex or large-scale events, the event organizer must be familiar with the incident management system(s)(IMS) that will be used both at the event and by local responders.

4.9.5 If an IMS is implemented within the event, the ESMP team should be integrated into it at the beginning of event phase 1.

4.9.6 People to fill positions within an incident management team (IMT) will often be drawn from competent persons from outside agencies and organizations and with appropriate experience and training.

4.9.7 Unless the event organizer is acting as the health and safety coordinator, the health and safety coordinator could serve as an assistant safety officer on the IMT, if an IMT is used. This would be especially appropriate in a large or complex incident.

4.9.8 Plans for major incidents must be approved and agreed to by all relevant parties, issued in writing, and located in a designated and agreed upon place (e.g., production management office) ready for use and reference.

4.9.9 For larger and/or more complex events, the event organizer must evaluate the need for an appropriate, designated, separate onsite space for the incident management center (IMC).

4.9.9.1 It is recommended that a secondary or backup location be identified and available for the IMC in case the primary location is deemed unsafe and/or must be evacuated. A designated primary and secondary space may also be a requirement of the AHJ. For smaller or less complex events, this could be the event's management office.

4.9.10 If a separate IMC is deemed necessary, the location of it should be developed according to the guidance provided in chapter 8, Venue and Site Design, in the *Event Safety Guide* (2014, Event Safety Alliance).

4.9.11 For events utilizing an IMS, the event organizer must have the IMC staffed at all times while work is occurring and during all event operations.

4.9.12 Circumstances for "off site" considerations are often considered and addressed in an emergency operations plan (EOP), which may be available for a venue or preexisting event space.

4.9.12.1 Traffic considerations must be included when planning emergency access and egress, as well as readiness for an off-site or area-wide incident occurring with consequences for the entire event.

4.9.13 If there is a major incident, the emergency services may dispatch command vehicles to the scene (i.e., large vehicles to provide shelter and resources for conducting incident management functions). These often very large vehicles must have unobstructed access to their preplanned and designated location(s), ideally as close as is reasonable in the given circumstances to the event organizer's (management or production) office or IMC. Vehicle access to the IMC may also be required by the AHJ.

4.9.14 Regardless of event size, the following incident objectives should be included in an incident action plan:

- Provide for safety and health of responders and incident personnel
- Provide safety and health for all event personnel and attendees
- Protect lives, provide care, and reduce suffering
- Protect property
- Protect the environment
- To the extent possible, protect and support government infrastructure
- To the extent possible, prevent, reduce and mitigate economic and social losses

4.9.15 The health and safety coordinator or ESMP team must be prepared for cancellation of the event. Therefore, the event must have messaging and announcements prepared regarding cancellation for event personnel, attendees, and other public information sources (e.g., local media).

4.9.16 For situation-specific protocols regarding communications and emergency public announcements, the guidance provided in chapter 6, Communications, of the *Event Safety Guide* (2014, Event Safety Alliance) should be followed.

5 Event phase 2: the event

Subparts of the event may be referred to as: the "install" or "load-in," when the event's operational elements are delivered, installed and checked. Activities that occur during this time period (i.e., load-in and load-out) are often fast-paced and therefore increase risk to event personnel due to issues like fatigue, and the quantity of personnel and equipment in operation. However, these activities are usually performed prior to open public access to the event site.

All event personnel and affected parties (e.g., first responders, AHJs, etc.) must be informed of important event safety and security features including, but not limited to, ingress, egress, and other emergency information during the event safety meeting. This information should be updated regularly by the health and safety coordinator by any means necessary as the set-up progresses and risks, hazards and locations change.

5.1 Load-in

Load-in is sometimes referred to as “preparation”, “build up”, or “set up”. It can be different in scope, depending on choice of the location, size, and environment. For permanent venues, the majority of the venue infrastructure will already be in place. For temporary venues, the venue infrastructure may need to be built. The event organizer must carefully consider how to minimize reasonably foreseeable risks for both load-in and load-out.

Once the venue’s infrastructure is ready, other equipment and services (e.g. event specific lighting, rigging, sound, staging, performers equipment etc.) will need to be brought to the site. This activity typically requires delivery and manual handling by event personnel. During this time, multiple elements often compete for the same space at the same time, so the logistics of these operations should be carefully planned.

The health and safety coordinator, in conjunction with the necessary authorized and qualified event personnel, must ensure the event’s infrastructure elements (i.e., electrical, stages, seating, tents, stages or other structures) are safely installed, erected, and monitored during operation. This may include engineering or AHJ-required site inspections, prior to use.

5.1.1 Event infrastructure should be constructed and monitored according to the guidance provided in chapter 8, Venue and Site Design, in the *Event Safety Guide* (2014, Event Safety Alliance).

5.1.2 For large or complex events, safety-related plans must be available to all relevant event personnel during the event in the production office or other designated location. For a larger or more complex event, this location would include the IMC.

5.1.3 For large or complex events, health and safety coordinators must ensure site maps are prepared, distributed, or displayed to show attendees the location of emergency egress and other important event safety and security features. These plans could be printed or electronically displayed on LED walls, sign boards, etc.

5.1.4 The arrival and movement on-site of all relevant load-in event personnel (such as contractors, equipment providers, labor crews, etc.) must be planned to ensure their activities on-site are safely coordinated. These activities should include but are not limited to:

- Artist and special guest transportation routes
- Cable routes
- Delivery truck routes
- Drinking water stations
- Emergency routes
- Entries (ingress) and exit (egress) points
- Generator placement
- First-aid and triage areas with ambulance parking locations, if applicable
- Merchandising, vendors, and other activations
- Construction of peripheral structures
- Positioning of sanitation and hand-washing facilities
- Shelter locations
- Stages, barricade construction

5.2 Load-out

Load-out is sometimes referred to as “dismantling,” “strike,” and “tear down.” This aspect of event phase 2 begins after the event has concluded. All health and safety management roles and responsibilities continue to apply during load-out.

5.2.1 Prior to load-out commencing, a specific load-out version of an event safety meeting must be held for all event personnel who will be exposed to load-out hazards. This load-out-related event safety meeting should include, but not be limited to, a review of the following topics:

- Emergency medical services (EMS) and load-out schedule
- Roles and responsibilities of each involved individual
- Site safety rules during load-out

- Reasonably foreseeable hazards, risks, and their mitigation

5.2.2 Load-out must not commence until all non-event personnel (attendees) are off-site.

5.2.3 If event personnel are not under the direct control or employ of the event organizer (such as subcontractors), the health and safety coordinator must take all reasonable efforts to inform event personnel of the assessed risks, which could be integrated into an agreement or contract.

5.2.4 Welfare of event personnel is planned for the load-out. At minimum, the health and safety coordinator must consider:

- Access to food
- Adequate lighting
- Equipment required
- Fatigue
- Hydration
- Sufficient numbers of event personnel
- Weather
- Workspaces

6 Event Phase 3: post-event

6.1 At a time convenient for all attendees, the event organizer should hold a post-event meeting with key event personnel to collect and evaluate all “as built” drawings and documentation as well as to determine the success and failure of any policies and procedures, including health and safety. This is considered an integral part of the post-event analysis and documentation of lessons learned.

6.2 If the event is to be re-built, all aspects of the ESMP should be reviewed and updated to incorporate any changes or improvements from the post-event analysis, and these changes/revisions communicated to all applicable event personnel.

6.3* For each event, accurate documentation of safety decisions, actions, successes, and failures must be initiated and maintained for consideration and improvement at future events.

Annex A – Supplementary commentary

A 2.2 The Health and Safety Executive (HSE) in the United Kingdom of Great Britain (UK) suggests that competence can be described as the combination of training, skills, experience and knowledge that a person has and their ability to apply them to perform a task safely. Other factors, such as attitude and physical ability, can also affect someone's competence. They define a competent person as, "not someone who simply has the competence to carry out a particular task safely." In general terms, they define a competent person as, "someone who has the necessary skills, experience and knowledge to manage health and safety" (<https://www.hse.gov.uk/competence/what-is-competence.htm>).

A 2.4 In the United States, OSHA requires that an emergency action plan must be in writing, kept in the workplace, and available to employees for review. Alternatively, an employer with ten or fewer employees may communicate the plan orally to employees (CFR 1910.38[b]).

In the U.S., OSHA (29 CFR 1910.38), and model fire codes (NFPA 1 and International Fire Code [IFC]) require an emergency action plan and specify minimum contents. In addition, OSHA requires that an employer have and maintain an employee alarm system, designate and train employees to assist in a safe and orderly evacuation, and review the emergency action plan with each employee covered by the plan when the employee is assigned to a new job, when an employee's responsibilities change, and when the EAP is changed. Regardless of whether OSHA rules apply, it is prudent for event organizers and health and safety coordinators to follow these standards.

A 2.11.2 The "show" or "event" (event phase 2) includes the period before and after a performance, presentation or event when the public or attendees occupy the event space. Event phase 2 is the operational period of the event. It begins when the event first occupies the venue and continues until all the event's elements are removed from the venue and the final walkthrough is performed.

A 2.11.3 The post-event phase begins when the event has relinquished control of the venue back to the venue owner.

A 2.12 Specifically, the ESMP includes documents describing how safety practices and procedures will be implemented while work is being performed within all phases of an event, including the management of crowds.

The ESMP is a written health and safety management document, collection of documents, and/or file. It states how the safety of all those present during the entire event will be managed and is a compilation of the various event safety policies, plans, and risk assessments. As such, it should detail how health and safety policies and plans are put into practice, including the findings from risk assessment(s).

A 2.22 The Incident Command System (ICS) is a scalable response system that can be implemented for all sizes of incidents, whether they are small issues, or massive emergencies, and it includes the goal of minimizing loss of life and assets. ICS is normally structured to facilitate activities in five major functional areas: command, operations, planning, logistics, and finance and administration. It is a fundamental form of management by objectives, with the purpose of enabling incident managers to identify the key concerns associated with the incident—often under emergency conditions—without sacrificing attention to any component of the command system.

Further information on various national models for incident management, incident command and incident response can be found at:

- USA: FEMA (Federal Emergency Management Administration) fema.gov
 - Search for NIMS (National Incident Management System) and ICS (Incident Command System)
- Canada: Incident Command System Canada : icscanada.ca

A 2.25 In the United States, the National Incident Management System (NIMS) guides all levels of government, nongovernmental organizations, and the private sector to work together to prevent, protect against, mitigate, respond to and recover from incidents.

A 2.29 JESIP (Joint Doctrine: the interoperability framework) in the UK defines “Major Incident” as an event or situation with a range of serious consequences which requires special arrangements to be implemented by one or more emergency responder agency. A major incident is beyond the scope of business-as-usual operations, and is likely to involve serious harm, damage, disruption or risk to human life or welfare, essential services, the environment or national security. It may involve a single-agency response, although it is more likely to require a multi-agency response, which may be in the form of multi-agency support to a lead responder. The severity of the consequences associated with a major incident are likely to constrain or complicate the ability of responders to resource and manage the incident, although a major incident is unlikely to affect all responders equally (<https://www.jesip.org.uk/uploads/media/app/Jesip-web-version/major.html>).

A 2.31 Minor incidents may involve few resources, be located within a small geographical area, and last for only a short time. They may include events such as a near-miss, when a forklift is carrying a load, and the load almost falls off the forklift, potentially injuring people and equipment. In the area of security, a minor incident could result in the loss of property through theft.

A 2.37 Although the definition of “risk” varies greatly across many domains, this traditional definition is widely accepted and adequate to convey the term’s meaning in this standard.

Bruce Lyon, P.E., CSP, SMS, ARM, CHMM and Georgi Popov, Ph.D., CSP, QEP, SMS, ARM, CMC, FAIHA published a peer-reviewed article in the *Professional Safety Journal* (March 2022) on the topic entitled “On the Concept of Risk, Uncertainty & Black Swans,” which can be found [here](#):

https://www.assp.org/docs/default-source/psj-articles/f1lyon_0322.pdf?sfvrsn=85d9247_0

This article is recommended reading for anyone interested in the definition of Risk.

A 2.39 in the United States, the Hazard Communication Standard (HCS; 29 CFR 1910.1200[g]), revised in 2012, requires that the chemical manufacturer, distributor, or importer provide Safety Data Sheets (SDSs) (formerly MSDSs or Material Safety Data Sheets) for each hazardous chemical to downstream users to communicate information on these hazards. SDSs are now required to be presented in a consistent user-friendly, 16-section format.

The SDS includes information such as the properties of each chemical; the physical, health, and environmental health hazards; protective measures; and safety precautions for handling, storing, and transporting the chemical. The information contained in the SDS must be in English (although it may be in other languages as well). In addition, the U.S. Occupational Safety and Health Administration (OSHA) requires that SDS preparers provide specific minimum information as detailed in Appendix D of 29 CFR 1910.1200. The SDS preparers may also include additional information in various section(s).

More details on SDSs in the United States can be found at:

<https://www.osha.gov/sites/default/files/publications/OSHA3514.pdf>

A 2.42 If one determines that a recommended activity is not going to be used for a particular event, it is also recommended that a user contemporaneously document the reason for that decision for future reference. This is because the root of the legal duty to behave reasonably under one's own circumstances is to have a reason, preferably a good reason, which is consistent with this standard.

A 3.2.4 Not all risk assessments are written. Small or simple events may only require an informal risk assessment, which in its simplest form is the time it takes to consider a situation before taking an action. A formal risk assessment, in contrast, documents everything that goes into forming an opinion about risk, including how the identified risks will be mitigated, managed, and/or controlled to an acceptable level.

A 4.1.1.2 It is important to clearly define the conditions under which these tasks must be delegated.

A 4.1.4 Usually through contractual requirements, the event organizer should be ultimately responsible for all event-related financial obligations, including those resulting from emergencies and liability under applicable regulations for acts or omissions.

A 4.1.5 Section 2(1) of the Health and Safety at Work Act (HSWA, 1974) in the UK states that, "It shall be the duty of every employer to ensure, so far as is reasonably practicable, the health, safety and welfare at work of all his employees" (<https://www.legislation.gov.uk/ukpga/1974/37/section/2>).

Similarly, in the United States, section 5(a)(1) of the Occupational Safety and Health Act (the "General Duty Clause") requires an employer to furnish to its employees:

"...a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees..."

A 4.2.3 There may situations when more than one competent advisor to the health and safety coordinator is necessary. For example, the health and safety coordinator may be perfectly knowledgeable, experienced, and qualified regarding electricity, working at height, and rigging, but know nothing at all about crowd management. In such a situation, it may be prudent to engage additional expertise and assign another health and safety coordinator, such as a specialist in crowd management, for the risks outside the expertise of the first health and safety coordinator.

A 4.3.13 Insurance, workers' compensation, and similar schemes may mandate the reporting of very specific information, which must be included on such a form. The required information will likely vary depending on the geographic location of the event and/or incident and the requirements of the authority having jurisdiction.

A 4.5.7 Communication and collaboration between the health and safety coordinator and the venue is especially important if the event, and its associated risks, is markedly different than the events usually held in the facility. For example, if a concert is to be held in a sports stadium with spectators allowed on the playing field, significant consideration must be given to evacuation procedures since having a large number of people on the playing field is not what the building, its exits, and the venue's customary evacuation procedures were designed for.

A 4.7.2 If an incident or accident occurs, it may be because a risk was not previously foreseeable. If this happens, the health and safety coordinator will need to identify, evaluate, mitigate and control to an acceptable level the now foreseeable additional risk.

A 4.7.3 Significant tent and overnight camping related safety risks may be include, but not necessarily be limited to, the following:

- First aid / Medical
- Life safety
- Fire prevention and fire suppression
- Minor and major incidents
- Crowd management
- Artist (talent) transportation management
- Temporary structures

- Site design
- Traffic and parking (for event personnel and contractors, as well as guests)
- Sanitation
- Security
- Weather

A 6.3 Documentation produced at a previous event can generate lessons learned that can serve as input when planning future events. It can also be a significant help should litigation related to the event arise later. What was once unforeseeable can now be anticipated, and even expected, after an incident or experience at a previous event.
